

Will PerfectPass work on my Inboard / Outboard ?

PerfectPass has been installed on hundred's of after market stern drive engines, and is a factory option on Rinker, SeaRay, SeaRay and Cobalt boats. Stern drives are versatile boats, but are challenging to drive at a consistent speed in the 20 mph range. PerfectPass has proven to be a valuable investment for wakeboarding enthusiasts.

Late model MerCruiser & Volvo engines in the following sizes are generally standard installations. (5.0, 5.7 & 6.2) PerfectPass will install on the Volvo 8.1, but is not available on the Merc 496.

Important information prior to ordering:

1. A 2 inch “thru hull” paddle wheel speed sensor must be installed in one of the following locations: **(1)** Just ahead of engine, typically about 8 – 10 inches from centerline of boat Or **(2)** Just behind the engine, about 10 inches from center and 8 inches from stern. You want to make sure there is adequate room to install and that your trailer does not have bunks in this location which could cause damage during loading.
2. Most all boats have what is referred to as a “pull to open” throttle. This means that when you push your throttle handle forward, the cable at engine pulls the throttle lever open towards stern. PerfectPass only works with this system. If the cable pushes the throttle open, this is not compatible.
3. Before ordering, if it is not a late model fuel injected engine, please confirm whether the throttle arm on engine (Where the throttle handle cable connects to engine) is on the passenger or driver's side)
4. Can I install it myself? – If you are relatively handy and comfortable with tools. If not, talk to a ski boat dealer in your area. “See dealer locator” at www.perfectpass.com
5. At time of ordering, we will need to know engine model and the face color (and bezel color) of your gauges.
6. PerfectPass products are 100% guaranteed. If you decide not to install or are not happy with performance, it can be returned within 60 days for full refund, less shipping.

Thank you.
